How to Help Save the Environment

SAVE THE ENVIRONMENT

How to Save the Environment

1. CONSERVE WATER

We can't live without water, the natural world around us needs water just as much as we do, so we can't save the environment without saving our water supply, as well. Conserving water starts with looking at it as a limited resource and consuming it with that in mind. A good way to force ourselves to cut down on water use is by installing Water Sense labeled appliances, such as low-flush toilets and low-flow showerheads and faucets. These water-saving devices can reduce water consumption by more than 30 percent

2. REDUCE REUSE RECYCLE

This trio of "R" words has become almost as pervasive as the old "reading, writing, arithmetic" combo. But it's no less important today than when it was first introduced.

- Reduce- It means reducing your consumption or buying less.
- Reuse- Rather than throwing out items like clothing or food jars, consumers can find new uses for them and thereby reduce their consumption of new resources.
- Recycle -Recycling extracts valuable materials from items that might otherwise be considered trash and turns them into new products.

3. PROTEST DEFORESTATION

On the name of development we're losing millions of trees that would otherwise clean the air for us. Protesting deforestation, both through activism and by refusing to buy products that are created at the expense of the world's forests, can help slow and even half deforestation.

4. PLANT MORE TREES

Trees play a critical role in keeping our air clean, both by releasing oxygen into the air and by trapping carbon. The more trees we have, the better our air quality, and that's why planting trees is an excellent step to take toward saving the environment

5. PRODUCING SUSTAINABLE ENERGY

Mankind will inevitably continue using energy, even if we all make a concerted effort to cut down on our consumption. So if we want to save the environment we need to find alternative ways to produce and use sustainable, clean energy , like solar and wind energy. The energy produced is called “ green ” energy that can help reduce our reliance on energy derived from burning fossil fuels
